The Course:

This course is mandatory for clinical students, in which they will learn theoretical and practical aspects related to research in psychotherapy. The emphasis is on empirical evaluation of processes and results.

Objectives:

(To gain an understanding of the basic concepts and discussions)

There are three related objectives to this course:

1. (Understand the history of research in psychotherapy)
2. (Develop the ability to critically read scientific articles on the methodologies related to such work)
3. (Provide tools for psychotherapy, where the goal is to understand the strengths and weaknesses of a given article to help determine the clinical effectiveness of a specific article for a specific patient.)

Learning Outcomes:

At the end of this course, students will be able to:

1. Describe the advantages and disadvantages of research in psychotherapy
2. Evaluate an empirical article on psychotherapy in terms of its strengths and weaknesses
3. Understand the issues related to building a research study of processes or outcomes in psychotherapy

Teaching Method:

Presentations, discussion of readings, lectures

Course Outline:

1. Definitions and History: psychotherapy, psychotherapists and treatment
   A. 1 week history of psychotherapy research
   B. Week 2. The scientific method and Psychotherapy
   third. Week 3. Methodological issues in the study of psychotherapy

2. Week 4 Does psychotherapy work? Do some types of psychotherapy work better than others?

3. Methodological Issues / The research study psychotherapy
   A. Single case studies
   B. 6. week control groups in the study of psychotherapy: What are the best ways to examine the specific effects?

4. What are the mechanisms of psychotherapy: specific factors vs common factors
   A. Specific factors and shared "the dodo bird?"
   B. 8. week randomized controlled trial (Randomized Controlled Trial) trial sets a gold standard by
